#### Necessary Tools (Not Included)

- Level
- Pencil
- Drill w/ Drill Bit
- Screwdriver
- Screws
- Screw Anchors (Optional)

![Diagram of HD Wall Mount Sign and its components](image-url)
**Step 1**
Using the provided suction cup, remove the acrylic lens from the HID patient focused signage. Remove the paper insert if present. If there is no paper insert, continue to step 2.

**Step 2**
Gently pull open the top and bottom slider tabs only. Leave them extended.

**Step 3**
Using a level, align the HID patient focused signage to its intended location. Using a pencil or other marking instrument, mark the locations of the 4 pre-drilled mounting holes. Drill 4 holes into the wall that correspond to the 4 mounting holes in the HID patient focused signage.

**Pre-drilled Mounting Holes**

**Step 4**
Using appropriate fasteners (not included), fasten the HID patient focused signage to the wall. Make sure that the screws are flush with the back of the HID patient focused slider sleeve (i.e. screwed in as far as they can go, so that the head of the screw is flush with the slider sleeve). If the screws are sticking out, the sign system will not function properly. *Note: Screw anchors may be necessary.*

**Step 5**
Close the top and bottom patient focused slider tabs.

**Step 6 (Optional)**
If you want to change the order of the tabs or remove the tabs from your patient focus sign, just pull tabs out. When the tab reaches the stopper you will need to continue with force to be able to remove the tab from patient focus sleeve.
